Deploy React Racing Game to GitHub Pages

Step 1: Create a GitHub Account (if you don't have one)

- Go to https://github.com
- Click "Sign up"
- Follow the setup process
- Verify your email

Step 2: Create a New Repository on GitHub

1. Go to https://github.com/new
2. Name your repository: `racing-game`
3. Add description: "A fun racing game built with React"
4. Choose "Public" (so it's visible to everyone)
5. Check "Add a README file"
6. Click "Create repository"

Step 3: Install Git on Your Computer

- **Windows**: Download from https://git-scm.com/download/win
- **Mac**: Download from https://git-scm.com/download/mac
- **Linux**: Run `sudo apt install git`

Step 4: Set Up Git Configuration

Open terminal/command prompt and run:

```bash
git config --global user.name "Your Name"
git config --global user.email "your.email@example.com"
```

Step 5: Clone Your Repository

1. Go to your repository on GitHub (https://github.com/YOUR-USERNAME/racing-game)
2. Click the green "Code" button
3. Copy the HTTPS URL
4. Open terminal/command prompt
5. Navigate to where you want the project:

```bash
cd Desktop
git clone [paste-the-URL-you-copied]
cd racing-game
```

Step 6: Create React App

```bash
npx create-react-app .
```

(The `.` means create it in the current folder)

Step 7: Add the Racing Game Component

1. Open the folder in a text editor (VS Code recommended)
2. Go to `src/` folder
3. Create a new file called `RacingGame.jsx`
4. Paste the full code from the RacingGame.jsx file I provided
5. Save it

Step 8: Update App.js

Replace the contents of `src/App.js` with:

```javascript
import RacingGame from './RacingGame';

export default function App() {
  return (
    <div style={{ padding: '20px' }}>
      <h1>Racing Game</h1>
      <RacingGame />
    </div>
  );
}
```

Step 9: Install GitHub Pages Package

In your terminal, run:

```bash
```

```
npm install --save-dev gh-pages
```

Step 10: Update package.json

Open `package.json` and add this line after `"private": true,`:

```json
"homepage": "https://YOUR-USERNAME.github.io/racing-game",
```

Then find the `"scripts"` section and add these two lines:

```json
"predeploy": "npm run build",
"deploy": "gh-pages -d build",
```

So your scripts section should look like:

```json
"scripts": {
  "start": "react-scripts start",
  "build": "react-scripts build",
  "predeploy": "npm run build",
  "deploy": "gh-pages -d build",
  "test": "react-scripts test",
  "eject": "react-scripts eject"
}
```

Step 11: Test It Locally (Optional)

```bash
npm start
```

This opens the game at http://localhost:3000

Step 12: Push Code to GitHub

In terminal:

```bash
```

```
git add .
git commit -m "Add racing game"
git push origin main
```

Step 13: Deploy to GitHub Pages

```bash
npm run deploy
```

This creates a `gh-pages` branch automatically and deploys your game.

Step 14: Enable GitHub Pages (if needed)

1. Go to your repository on GitHub
2. Click "Settings" (top right)
3. Click "Pages" in the left sidebar
4. Under "Source", select "gh-pages" branch
5. Click "Save"

Step 15: View Your Game

Your game is now live at:

```
https://YOUR-USERNAME.github.io/racing-game
```

Replace `YOUR-USERNAME` with your actual GitHub username.

Updating Your Game

Whenever you make changes:

```bash
git add .
git commit -m "Describe your changes"
git push origin main
npm run deploy
```

Troubleshooting

Game not showing?

- Wait 1-2 minutes for GitHub Pages to update

- Check your browser's developer console (F12) for errors
- Make sure your repository is public

Can't clone repository?

- Make sure Git is installed
- Check your HTTPS URL is correct
- Try using SSH URL instead (in Code dropdown)

Build errors?

- Make sure you're in the `racing-game` folder
- Run `npm install` again
- Check that `RacingGame.jsx` has no typos
